

## PIXEL PERFECT DESIGN PRACTICE

We need a pixel perfect coding style for the attached psd based design.

Main purposes of this practice are as follows:

- Measuring coding capabilities in responsive HTML & CSS.
- Observing the level of the developer's attention and patience.
- Measuring the usage of proper time and resources.
- Using the latest technologies and improvements in CSS3.

General considerations:

- Layout will be a fixed width of 860 pixels, and horizontally centered within the page.
- Use Bootstrap 4 with Grid & Flex utilization.
- Icons will be imported as SVG from Bootstrap icons, <https://icons.getbootstrap.com/>
- Main layout will be based on CSS Flexbox.
- Casino games section needs to be implemented using CSS Grids.
- Typography needs to be strongly followed, pay attention to font families, styles and weights.
- No functional issues are present with no links to be followed or search boxes to be implemented. Only coding will be evaluated within this practice.

Please pay attention to some points while coding your work:

- Try to use CSS-ways as the first approach to a solution of an issue.
- You may use colorful images as backgrounds but not for simple components like arrows, carets etc. Implementing those tiny components in CSS is a plus.
- SASS usage is strongly advised, which is a plus.
- Mixin knowledge is also a big plus while coding webkit related CSS rules such as border radiuses, box shadows, gradients.
- Try to implement all box shadows and gradients as their properties are dictated by related PhotoShop menus.
- Different Google fonts need to be included, margin & padding adjustments are to be strongly followed.
- There are some custom coding requirements such as a scrollbar and some placeholders.
